

CurveOdds

Every launch has a price. Now it has odds.

Most token launches never fill their bonding curve. The one question every buyer asks, *will this graduate?*, has no price anywhere.

Today the only way to hold a view on a launch is to buy the token and hope. Believers can't back a launch without taking memecoin risk; sceptics can't express a view at all.

Graduate to

A curve config built for launches people bet on.

ANTI-SNIPE FEE Exponential scheduler, 5% → 1% over ten minutes, plus dynamic fee.	CREATOR SHARE 50% of trading fees. Pays back the market after ~10k USDC volume.
LOCKED LIQUIDITY 100% of graduated LP permanently locked, split creator / platform.	IMMUTABLE TOKEN Fixed 1B supply, mint and metadata locked at creation.
USDC QUOTE ON MAINNET Fees accrue in the currency Panta markets settle in.	RESOLVABLE GRADUATION finish_curve_timestamp on the pool is the market's source of truth.

Non-custodial, end to end.

01 quote Question, rule and sources are generated from the pool: mint, pool address, threshold, deadline.	02 build Panta returns an unsigned v0 transaction; the backer's wallet signs it in the browser.	03 register Signature is registered; the launch is linked to the market id.	04 trade YES / NO primary buys through quote → build → submit. Odds show on the board.
---	---	---	--

Markets are **breaking** markets with the event in progress: the launch is already live, so the first hour is the most informative one. API key stays on the server; the browser only sees unsigned transactions.

LIVE BOARD					Newest	Closest to graduation
TOKEN	CURVE	RAISED	MKT CAP	GRADUATION ODDS	AGE	
B Last Call \$CALL	0% 5 SOL	0 SOL	1.56 SOL	NO MARKET	1m	
B Late Bloomer \$BLOOM	4% 5 SOL	0.200 SOL	1.96 SOL	NO MARKET	2m	
S Slow Money \$SLOW	18% 5 SOL	0.899 SOL	3.70 SOL	NO MARKET	2m	
O Second Opinion \$OPIN	curve complete 5 SOL	5.00 SOL	25.00 SOL	NO MARKET	2m	
P Paper Hands Club \$PHC	56% 5 SOL	2.78 SOL	11.11 SOL	NO MARKET	2m	
S Night Shift \$SHIFT	82% 5 SOL	4.10 SOL	18.70 SOL	NO MARKET	3m	

The platform is the DBC partner.

It earns the partner share of trading fees while a launch is on the curve, and fees from its half of the permanently locked LP after graduation. Launches that fill are the ones that pay, which aligns the platform with the question its markets ask.

NEXT

Mainnet with the USDC-quoted config.

Platform-funded markets: partner fees open a market automatically for launches that pass 25% of the curve.

Odds as a signal: an API that trading terminals can read next to price.

Working: launch, trade, curve progress and completion on DBC, tested end to end.

Implemented: Panta create, register, primary buy and odds; live markets need mainnet USDC.

Open source: Next.js, DBC SDK, wallet adapter; demo wallet for test networks.
